ANYBODY FOR A RED, DELICIOUS RECYCLED FISH?

fertileminds

It's the ultimate form of recycling: much of the world's fertilizers come from remnants of ancient sea life. Like phosphate, for example, which is mined from ore deposits that are rich in fossilized sea remains. Phosphate is mined from the ground and converted into a form that plants, including apple trees, can digest. Who would have thought that apples, which are high in phosphate, are actually recycled fish? For more information about fertilizer, food and the environment, log on to **www.nutrientsforlife.org**
